

Day 3 Speaker Notes

3.5 Dynamic Programming – Problem Study Wedding Shopping

- Write problem parameters on the board

3.5 Dynamic Programming – Example Test Cases

- Write test case 1 on the board

3.5 Dynamic Programming – Bottom-Up

- WRITE ON BOARD
 - Determine the required set of parameters that uniquely describe the problem (the state)
 - If there are N parameters required to represent the states, create an N dimensional array (DP table), with one entry per state.
 - With the base-case cells/states in the DP table already filled, determine the cells/states that can be filled next (the transitions)
